Introduction to Design Tools for HCI

Intended Learning Outcomes

This activity aims to demonstrate the utilization of design tools (such as Figma) in the design of an interactive application, and the creation and testing of an application prototype.

Objectives

After this activity, the students should be able to:

1. Design an application screen.
2. Create and test an application prototype.

Materials

- **Personal PC**
- **Figma Account**

Discussion

Figma is a collaborative interface design tool that's taken the design world by storm. Unlike Sketch or Adobe Illustrator, which are standalone applications, Figma can be run entirely from a web browser and, therefore, works not only on Macs but also on PCs running Windows or Linux, and even on Chromebooks. It's also free to use! Another big advantage of Figma is that it allows real-time collaboration on the same file. When using conventional "offline" apps like Sketch and Illustrator, if designers

want to share their work, they typically have to export it to an image file and then send it via email or instant message.

In Figma, instead of exporting static images, we can simply share a link to the Figma file for clients and colleagues to open in their browsers. This in itself saves significant time and can streamline a designer's workflow. But more importantly, it means that clients and colleagues can interact more richly with the work and review the latest version of the file.

Students are instructed to read through the following material:

- [Introduction to Figma](#)

Procedures

Using your previously designed GUI application, remake the application's design in Figma. The design must follow the given instructions as follows:

- [Designing an App Screen](#)
- [Creating a logo and an icon set](#)
- [Designing additional app screens](#)
- [Creating and testing the prototype](#)
- [Create a tablet and desktop application](#)

Output

Please see the attached file "Cheffeur Reheated - BULAONG" within the submission. Thank you.

Supplementary Activities

Evaluate your new design compared to your old application; did you follow more of the design 10 commandments?

Yes, my new design follows the 10 Commandments of Design by Dieter Rams. My old GUI application from OOPB (Cheffeur) takes almost no consideration for UI/UX; purely just for functionality. My new design, however, modernizes and innovates the ideas from my old design, and creates something more powerful: Cheffeur Reheated, that takes all of the key traits that Cheffeur has such as searching for recipes and macro tracking, and improves it to fit not only modern standards, but for the betterment of the people using it.
