

VR-based Project Design Document

03/12/2026

Name

Bulaong, Ross Andrew D.

Esguerra, Serge

Madriago, David

Palomares, Charles Yexel

Reyes, Jamie Rose

Project Concept

1

Player Control

You control a

CapsuleObject (invisible to camera because the game is in First Person)

in this

First Person Perspective

game

where

WASD

makes the player

Move forward, left, right, and backwards respectively.

2

Basic Gameplay

During the game,

Interactable objects such as flasks, receipts, and people

appear

from

The environment

and the goal of the game is to

Solve the predicament that the in-game characters are experiencing.

3

Sound & Effects

There will be sound effects

description of sound effects

and particle effects

description of particle effects

[optional] There will also be

description of any other expected special effects or animation in the project.

4

Gameplay Mechanics

As the game progresses,

Players are able to solve different problems by interacting with different objects which provide a different type of gameplay

making it

Aligned with the goal of the project which is to improve Filipino grade 6 students' critical thinking in a gamified manner.

[optional] There will also be

Pieces of dialogue that are essential to the flow of the game. Such as in scene 2, where the whole point of the game is to analyze conversations and read in between the lines to solve the problem.

5 User Interface	The	will	whenever
	Player	Revert back to a specific checkpoint	The player makes a crucial error, teaching them that their actions in the game has consequences and further improving their ability to make decisions by thinking critically.
	At the start of the game, the title		and the game will end when
	SHERLOCK HOMEWORK	will appear	All of the problems within the specific "episodes" (case files) are solved by the player.
6 Other Features	None, all were addressed.		

Project Timeline

Milestone	Description	Due
#1	Main Menu UI and functionality for each case file redirect	March 8
#2	Creation of all the in-game environments that the player will explore, including assets, NPCs, and room design.	March 14
#3	Creation of essential scripts that would handle the in game logic and interactable objects	March 16
#4	Creation of checkpoint system for progress reverting of the player as well as player error handling	March 18
#5	Compilation and application of audio, particle effects, and victory screens. Final package building, bug testing, then pushing in main branch of repository for production	March 23
Backlog	Designing of github repository, creation of "box art" for Unity Play Link thumbnail, and other small, minute details done to improve the image and eye-candy of the game	March 26

Project Sketch

24/02/2026

Feb. 24, 2026

Main Problem: The science experiment for the science Fair is believed to be missing, and the detective must figure out what happened in the lab using science clues.

- 1.) This frame shows the main menu.
- 2.) The detective walks down a dimly lit hallway. The science lab door is slightly open.
- 3.) The detective steps inside and notices the lab is quiet but messy. A half-melted beaker of ice sits on the table with water droplets scattered around.
- 4.) Three students stand nervously near table because they were the last ones to practice in the lab. They are worried they might be blamed for the missing experiment.
- 5.) Bea explains that they practiced for the Science Fair using ice in their experiment. The detective listens carefully to understand what kind of experiment was performed.
- 6.) The detective touches the beaker and feels warmth, confirming that heat affected the ice. This helps explain why the ice turned into water.
- 7.) The detective studies the melting ice, water drops, and foggy glass. He/she realizes these changes can explain what happened to the experiment.
- 8.) The game asks the detective to identify the change of state when ice melts. Answering

correctly helps prove what happened during the experiment.

1.) The cabinet unlocks, revealing the experiment safely stored inside and not stolen. The teacher praises the detective for solving the problem by understanding changes in matter.

Problem: The experiment seems missing and the lab is messy

Task: Use science clues to explain what happened

Solution: The ice melted due to heat, and the experiment was safely stored, not stolen
